

About Ecosystem

We believe everything can and should be more efficient.

This holds true for buildings, energy systems, the project delivery approach, and the collaboration with our clients. This is the foundation our business is built on.

Our clients are leaders in the institutional, industrial, and commercial sectors in North America. Many of you are facing the challenges created by costly, aging, and ineffective energy ecosystems. This is where we come in.

We work with our clients to align our interests and identify the outcomes important to them. From the outset, we believe that accountability for achieving the outcomes that matter to our clients should completely lie with us. After all, we are engineers with three decades of experience in improving energy systems in existing buildings, with proven expertise and a track record of innovation.

To be accountable, we've built a business that re-connects engineering design, construction and commissioning with a total focus on delivering results. This way, we can contractually guarantee the outcomes that mean the most to our clients.

About Ecosystem

Integrated engineering and construction

We don't think our clients should be left wondering whether you will get the results you seek. So we rejected the old model of "design then build then hope it works." In its place, we created a new business model with a total focus on the results that matter to our clients.

We bring together in-house experts for each project phase, including engineers, CEMs, CMVPs, drawing experts, construction managers, site supervisors, commissioning specialists, and teams dedicated to incentives, performance tracking and verification, communications and awareness, and training.

Ecosystem project teams combine engineering expertise with a deep understanding of practical application in the toughest operating environments.

Guaranteeing the results important to you

Our clients are looking for innovative energy retrofit projects that deliver real results. We operate as an extension of your team and commit to shared values. That's why we guarantee results, sharing the risk that you typically deal with in construction projects. Ecosystem is one of the few firms on the market with the desire and expertise to contractually guarantee the measurable outcomes that mean most to you, from project cost, savings, and incentives, to schedule and operational performance. For almost three decades, we have consistently surpassed our targets.

Every choice we make in project design and implementation contributes to better outcomes – we guarantee it.

Your partner for the energy transition

Ecosystem is committed to making progress toward an environmentally responsible energy future, and we have a dedicated role to play helping our clients along the path to carbon neutrality. Our holistic approach to projects in the built environment, combined with our proven expertise in delivering meaningful energy savings, enables us to develop measurable and achievable decarbonization programs.

We are inspired to rework the built environment for efficiency and sustainability.
